Relation between forests and the retention of atmospheric and soil moisture.	12

GOVERNMENT OF INDIA.

DEPARTMENT OF REVENUE AND AGRICULTURE.

FORESTS.

Simla, the 21st July 1915.

The following review of forest administration in British India during the five years ending the 30th June 1914 is published for general information.

*Review of Forest Administration in British India during 1909-1914.*

1. The areas controlled by the Forest Department are classed either as reserved, protected or unclassed State forests. In reserved forests boundaries are clearly defined and demarcated and rights carefully recorded at settlement; in protected forests boundaries are not always demarcated and the record of rights is less perfect; while in the large areas of Government waste, known as unclassed State forests, systematic management is not attempted and the control of the Department is confined, generally speaking, to revenue collection until suitable blocks are converted into reserved or protected forests or until areas are taken up for cultivation.

On the 30th June 1914, at the close of the quinquennial period now being dealt with, the total forest area in British India (including the Shan States) was 245,612 square miles, of which 96,297 square miles were reserved and 8,390 protected forests, the remainder (140,925 square miles) being unclassed State forests. It is a striking fact that of the total area of British India (including the Shan States) more than one-fifth is under the control of the Department and nearly one-tenth under regular protection.

Between 1909 and 1914 the net increase in the area of the reserves was 1,736 square miles. In the Central Provinces, no less than 2,237 square miles classed as suitable for the extension of cultivation were disforested for this purpose, while in Burma 3,751 square miles of unclassed forest were reserved. Elsewhere, the reserved area remained fairly steady, and in most parts of India no marked variations are to be expected. The reserved area, however, may be increased by the conversion of protected into reserved forests and this indeed is contemplated on a large scale in the United Provinces, while on the other hand the reserved area is from time to time reduced by the relinquishment of isolated blocks which do not repay the trouble and expense of management or by the disforestation of areas required for ordinary cultivation. In Burma and Assam, however, where there are very large areas of unclassed forests, considerable portions of which might, without prejudice to the demands of cultivation, be brought under permanent control, further provision for the future is necessary by the reservation of suitable areas.

During the quinquennial period forest surveys, mainly on the scale of two inches to the mile, were carried out over 5,300 square miles in all provinces except Bengal, by the Survey of India. At the close of the period 77 per cent. of the total area of reserved and protected forests had been surveyed.

2. Until his retirement in April 1913, the appointment of Inspector General of Forests was held by Mr. F. Beadon Bryant, C.S.I., when he was succeeded by Mr. G. S. Hart, C.I.E., the present incumbent. Mr. L. Mercer, C.I.E., the President of the Research Institute, officiated for three months in 1911 and Mr. M. Hill, C.I.E., for six months in 1914.

During the period under review the tours of the Inspector General extended over portions of Bengal, Assam, the United Provinces, the Punjab, the Central Provinces, Burma, Madras, the Andamans, Coorg and Kashmir. These tours are of the greatest value not only to the Government of India but also to Local Governments and local officers, as they enable an independent opinion on professional matters to be obtained from an officer of wide experience and tried ability. Thus, to quote two instances only, the value of Mr. Beadon Bryant's note on Forest Revenue and Expenditure in Madras has been warmly acknowledged by the Government of that Presidency, while Mr. Hart's note on the Burma forests deals with questions of vital importance and may have considerable influence on their future management.

In the provinces forest work is controlled by Conservators and in Burma and the Central Provinces by Chief Conservators. These latter posts are of somewhat recent date, having been created in Burma in 1905 and in the Central Provinces provisionally in 1906 and permanently in 1911. But the experience gained during the past ten years has been sufficient to shew that the appointments were fully justified both on financial and on administrative grounds. Technical work is co-ordinated; one adviser, in place of several, is given to the Local Government; and forest revenue increases. Recently a Chief Conservator has been sanctioned for Bombay and the creation of a similar appointment for the United Provinces is now under consideration.

3. An important reform effected in 1910 was the constitution of a Board of Forestry, composed of representative Conservators and Chief Conservators under the presidency of the Inspector General of Forests. Meetings are held at intervals of three years when the programme of research work is considered and questions connected with the Research Institute and College and forest administration generally are discussed. The first meeting of the Board was held between the 31st March and 6th April 1910 and the second between the 24th and 29th March 1913. As a means of furthering the cause of forest education and research, of stimulating commercial exploitation, of co-ordinating work and of interchanging ideas, the Board of Forestry has already proved its value. With the creation of this Board, the old Board of Control of the Imperial Forest College was abolished.

4. Officers of the Imperial Service are recruited under covenant with the Secretary of State and receive their training in England and on the Continent. After the abolition of Coopers Hill College in 1905, probationers were trained at Oxford, but in 1911 it was decided that training might be undergone at any British University possessing a forest school approved by the Secretary of State, and probationers can now be trained at Oxford, Cambridge and Edinburgh. Instruction at these centres is supplemented by a course of practical training in selected forests on the Continent under the supervision of a Director of Indian Forest Studies.

Up to the year 1906 members of the Provincial Service were recruited by the promotion of men who had served for a period of years as Rangers. In 1906, with the object of raising the standard of the Provincial Service, a system of direct appointment was introduced and the candidates chosen, either Rangers already in service or young men of good education and social standing, were required to undergo a third year of training at Dehra Dun in addition to the ordinary course of two years. On the completion of this course and of three years' approved service either as Ranger or Probationary Extra Assistant Conservator, the candidate became eligible for permanent promotion to the Provincial Service. This system, which was at best a temporary measure, proved unsatisfactory, and in 1912 a separate two years' course for Provincial Service candidates was prescribed. There can be no doubt that this is a great improvement on the old method of recruitment, but the candidates selected for training have not always been of the standard required, and the Government of India desire to impress on Local Governments and Administrations the importance of careful selection. The lectures, which are given in the new

Forest Research Institute buildings at Dehra Dun, are supplemented by an extensive course of practical training in various parts of India. The arrangements for controlling and housing the students are unfortunately still defective but an estate adjoining the Research Institute has now been acquired and suitable quarters are being erected.

Except in Burma and Madras Rangers are trained at the Forest College, Dehra Dun, but for some years past the

(c) *Subordinate Services.*

defects of centralized training have been manifest as, owing to the size of the classes, sufficient attention cannot be given to individual students. The inauguration in 1908 of an English course at the Burma Forest School and the opening of the Madras Forest College at Coimbatore in 1912 have had little effect in relieving the strain as, with additions to the staff, demands from other provinces have increased. As the present state of affairs is so unsatisfactory and as it is desirable that at Dehra Dun attention should be concentrated on the training of candidates for the Provincial Service, it has been decided to decentralize the training of Rangers. Arrangements to give effect to this decision are being made with Local Governments and Administrations and it is probable that within the next two years provincial schools will be started throughout India.

The training of subordinates below the rank of Ranger is carried out locally in forest schools and training classes.

5. During the quinquennium the increasing activities of the Department

*Strength of the Staff.*

have rendered necessary considerable additions to the staff. The sanctioned strength of the Imperial Service increased from 205 to 214, and the actual strength from 196 to 237. In the case of the Provincial Service the sanctioned strength (excluding probationers) increased from 194 to 213, and the number employed from 160 to 197. In addition, 32 Probationary Extra Assistant Conservators were employed at the close of the quinquennium.

The appointment of Chief Conservator of Forests, Central Provinces, and a fourth Conservator for Madras were permanently added to the cadre in 1911, while the reorganization of the cadre in the United Provinces and a Chief Conservator for Bombay have been sanctioned since the 30th June 1914. Following the territorial changes made in 1912, the three forest circles of Bengal and Eastern Bengal and Assam were distributed over the three new provinces and a second Conservator was sanctioned for Assam. Considerable additions were made to the subordinate and clerical staffs in several provinces.

6. Fire-protective measures consist chiefly in maintaining cleared fire lines,

*Fire-protection.*

external and internal, in organizing an efficient system of patrol, in enlisting the co-operation of the local population, in extinguishing any fires which may arise and in burning inflammable grass lands early in the season. **Conservation and improvement.**

During recent years the method of early burning has been extended experimentally to some Himalayan forests which are more than usually inflammable, and where regeneration operations are not in progress, and to areas in other parts of India in which the stock is not of sufficient value to justify the cost of complete protection.

Now that fire-protective measures have been carried out over considerable areas for several decades it is possible to come to some conclusion regarding their effect. In the majority of cases the forests have greatly benefited and there can be little doubt that in many types of forest the improvement that has occurred in the growing stock has been due mainly to the effects of fire-protection. At the same time, it must be admitted that in certain cases fire-protection, so far as the natural regeneration of the forests is concerned, has been decidedly harmful as the encouragement given to inferior species and weeds has wholly or partially prevented the survival of seedlings of the principal species. This result has been observed for some time past in the moister types of teak forest in Burma, and it is now generally recognized that in forests of this class fire-protection should be abandoned. Thus, during the last year of the quinquennium the area under protection in Burma has been reduced from 7,727 square miles to 4,548 square miles. It is doubtful, however, whether in teak forests of this class

- adequate reproduction can be secured merely by abandoning fire-protection and concentrated regeneration measures will probably also be required.

Another important example of the adverse effects of fire-protection on regeneration has recently come to light in the *sāl* forests of the Bengal and Assam Duars where continued protection has converted the undergrowth, which previously consisted largely of Savannah grasses, into a dense mass of evergreen shrubs and *sau* grass and has so affected the soil aeration that *sāl* seedlings entirely fail to establish themselves. Intensive weedings and experiments in cutting and burning the undergrowth have so far met with little or no success, and it is possible that clear felling and artificial regeneration with the aid of field crops may prove to be the only satisfactory method of ensuring the permanence of the *sāl* in these very valuable forests.

Among injuries from natural causes, local damage from storms, frost, snow and other agencies are of more or less regular occurrence, though no cases of special severity have been reported during the past few years. The abnormal drought caused by the partial failure of the monsoon in 1907 and 1908 had serious results and in the *sāl* forests of Oudh several lakhs of trees died. Investigations have shown that the death of these trees was due primarily to the lowering of the subsoil water-level following deficient rainfall, the mortality being most severe where there was a thick stratum of non-hygroscopic sand in the subsoil.

7. No light has yet been thrown on the cause of the mysterious spike-disease which attacks the sandal tree, though this question is still under investigation. In Coorg alone, nearly 20,000 affected trees were uprooted during the past five years, and although the intensity of the disease has not been reduced, it has not spread to areas previously unaffected. Among dangerous fungoid pests in Himalayan forests may be mentioned *Trametes Pini*, which attacks the blue pine (*Pinus excelsa*), obtaining admission through wounds, particularly where lopping is practised, and *Peridermium Cedri*, a deodar needle fungus hitherto believed to be of little importance, but now known to be the cause of considerable damage in deodar plantations in Kulu. Recently a virulent fungus, not yet identified, has been found on the roots of the *sāl* in the Bengal and Assam Duars, and it seems probable that this fungus is largely responsible for the unusual mortality which has been noticed for some years past among the *sāl* trees of this tract. Steps are now being taken to investigate its life history and to devise, if possible, remedial measures.

Among the noxious weeds at present occupying the attention of the Forest Department, the most important is *lantana*, a shrub which was introduced from tropical America in the early part of last century and which spread so rapidly that for many years past it has covered extensive tracts in Southern India to the exclusion of nearly all other forms of vegetation. Energetic measures for the eradication of this weed have been commenced in Coorg, where during the past two years 4,408 acres have been cleared and 1,241 acres cleared of regrowth, at a cost of Rs. 39,134. A scheme for the systematic eradication of *lantana* has also been prepared, and the plant has been the subject of special legislation in the shape of the Coorg Noxious Weeds Regulation of 1914.

Insect pests continue to be studied by the Forest Zoologist, but no measures of control have yet been put into force, although these may possibly become necessary when more intensive silvicultural operations are undertaken.

8. Forestry in India is closely connected with grazing, the intensity of which varies in different provinces, and as excessive grazing is harmful this question is unfortunately at times the cause of friction between the Forest Department and the people. In the Central Provinces and Berar, the sound policy has been adopted of granting liberal concessions in the case of cattle kept for agricultural purposes, higher fees being levied in other cases. In Madras, the grazing question became so acute that a special Forest Committee was appointed in 1912 to consider and report on this and kindred matters. The Committee recommended that forests in which scientific working and control are essential should be classified separately from those maintained primarily for the supply of village requirements and grazing, and that the

latter should be placed under the control of village panchayats or local committees. Effect is now being given to this recommendation and it is hoped that the measures adopted will result in smoother working. In excluding goats from reserved forests, so far as possible, the Madras Government have adopted a policy which the Government of India desire to commend to the consideration of the Governments of those provinces where this destructive form of grazing is permitted.

9. The afforestation of denuded hill-sides and ravine lands has received some attention during the past few years, particularly in the Punjab and the United Provinces.

*Afforestation.*

The Government of the United Provinces in 1912 announced a definite policy of afforestation which provided for the reclamation of ravine lands and the formation of fuel and fodder reserves in the drier tracts of the plains, and to give effect to this policy an Afforestation Division has been constituted. A systematic survey of waste lands has been started in the Jhansi, Hamirpur, Jalaun and Etawah districts, and the work of reclamation and afforestation has already been taken in hand. These measures, which affect so closely the well-being of the agricultural population, may have far-reaching results, and their progress will be watched with interest.

10. Plantation work continues to progress in many provinces. In the Andamans mangrove plantations for the supply of fuel extend over 685 acres, while Para rubber plantations now aggregate 191½ acres. Some 550 trees planted in 1906 were tapped in 1913-14 and a sample of 158 lbs. of rubber was sent to London for sale where it realized Rs. 1-9-0 per lb. *Padouk* sowings on areas cleared for the supply of fuel to the Settlement now cover 1,300 acres, while teak plantations, though of small extent, show considerable promise.

*Plantations.*

In Assam, rubber plantations have now been in existence for many years and are still being extended, but seeing that the selling price of *Ficus elastica* is low it would appear desirable carefully to examine financial results before further extensions are carried out.

In the Punjab, excellent progress has been made with the scheme for the formation of irrigated plantations for the supply of fuel in the Canal Colonies. These plantations when complete will cover 50,000 acres.

In Burma, satisfactory progress has been made in the extension of teak *taungya* plantations. Doubts have been expressed as to the wisdom of extending these plantations, on the ground that the staff and labour necessary for their upkeep is insufficient, but although it may be admitted that plantations which cannot receive adequate attention are of little value, the fact remains that these plantations have demonstrated that teak can be successfully grown in this way. As the demand for teak is considerably in excess of the supply, every effort should be made to increase the outturn of this valuable timber, and the extension of teak plantations in Burma should therefore be continued. Many of the difficulties of control now experienced are due to the fact that small plantations are scattered over wide areas and the marked success which has been obtained in the Nilambur plantations in South Malabar shews what can be done when a well-considered scheme is carried out.

11. Under the general declaration of policy made by the Government of India in 1894, the forests of India were broadly classed into (a) Forests the preservation of which is essential on climatic or physical grounds, (b) Forests which afford a supply of valuable timbers for commercial purposes, (c) Minor forests and (d) Pasture lands. The system of management depends upon the objects in view and necessarily varies with the class of the forest, so that while in classes (a), (c) and (d) simple rules are ordinarily sufficient, special treatment on scientific and economic lines is necessary in forests of the second class. The management of such forests requires carefully prepared working plans and as without such plans systematic management is impossible, their preparation becomes a matter of vital importance.

*General.*

**Forest Management.**

The progress made in the preparation of working plans during the past 25 years is shewn in the following statement:—

Period ending 30th June.						Area under working plans at end of last year of period.	Progress during the quinquennium.
						Square miles.	Square miles.
1889	...	...	...	...	...	912	...
1894	...	...	...	...	...	10,279	9,367
1899	...	...	...	...	...	21,620	11,341
1904	...	...	...	...	...	34,222	12,602
1909	...	...	...	...	...	48,104	13,882
1914	...	...	...	...	...	53,926	5,822

The progress made in the preparation of new working plans during the past five years is disappointing. It is true that existing plans have also to some extent been revised but the amount of revision work carried out does not account for the short outturn. Nor is it the case that plans have been compiled for the greater portion of the area for which they are required, since at the end of the year 1913-14 plans had only been prepared for 53,926 square miles out of 86,358 square miles for which they were required. Leaving out of account revision work, it may be said that in the United Provinces, Punjab and Bihar and Orissa plans have been prepared for the greater part of the forests for which they are required; this work is well advanced in the Central Provinces; less advanced in Bengal and Bombay; and backward in Burma, Assam and Madras. In the latter provinces maps of the forests are not in all cases available; but the main cause of the present state of affairs is the inadequacy of the trained staff and unless the staff is strengthened this difficulty will become more acute with the development of forest operations and the necessity for more intensive working, with the constant demands for revisions of existing working plans and, in provinces in which new reserves are being formed, with the increased demand for new plans. Apart from this, many of the areas which at present do not require plans will, as communications improve and new demands spring up, have to be brought under scientific management.

The Government of India desire to impress on Local Governments and Administrations the great importance of compiling plans with as little delay as possible for all areas for which they are required and they trust that in the next five years more substantial progress will be made. They recognise that without an adequate staff this cannot be done, but in recent reorganizations of provincial cadres provision has been made for special working plans officers and the necessity for this should not be overlooked when additions to the staff are considered.

12. The following statement shows the areas and percentages under various methods of treatment in provinces other than Bombay and Madras:—

Method of treatment.				Area in square miles.		Percentage of total area under each method of treatment.	
				1909-10.	1913-14.	1909-10.	1913-14.
System of clear fellings by compartments	...	...	...	5	14	014	036
Uniform system	...	...	...	184	150	523	387
Group system	...	...	...	1	95	003	245
Selection method with improvement fellings	...	...	...	11,700	15,802	33'228	40'759
Simple coppice	...	...	...	124	161	352	415
Coppice with standards	...	...	...	2,909	3,234½	8'262	8'342
Method of Improvement fellings	...	...	...	7,898	(a) 8,880	22 430	22'905
Unallotted	...	...	...	(a) 12,390	(a) 10,432½	35'188	26'911
Total	...	...	...	(b) 35,211	38,769	100'000	100'000

(a) Includes forests for which working plans have been prepared but which are not under any definite system of working.

(b) Includes 14 square miles of reserves in Bengal which are not under the control of the Forest Department.

(c) Excludes 4 square miles worked experimentally in the Northern Circle, Central Provinces.

There has been no marked increase in the area under high forest systems involving concentrated fellings. Nevertheless, in recent years the tendency has been to break away from the provisional methods of treatment known in India as selection or improvement fellings, in which measures for securing adequate regeneration are too often neglected, and to adopt more rational systems of management based on the silvicultural requirements of the species and the regeneration of the normal area. This tendency is most marked in the United Provinces and the Punjab, where several working plans on improved lines are now under preparation. In Burma, a system of working the teak forests by regenerative measures concentrated over definite areas was discussed at a Conference held in 1910; but so far little appears to have been done to give effect to the recommendation that in certain areas these improved methods should replace the method of selection fellings.

The substitution of improved systems of management for the provisional methods which have hitherto been followed is of great importance. The Government of India recognise that this can only gradually be brought about and that in many localities provisional methods must be continued for some time to come, but as experience is gained of the silvicultural requirements of the species and of the best methods of treatment, more advanced systems of management will, it is hoped, be adopted.

13. The successful working of the forests must depend largely upon the extent to which facilities for extraction are provided and a satisfactory feature of forest

**Exploitation and  
Commercial Development.**

*Communications and buildings.*

administration during the past five years has been the substantial amount spent upon this object. Numerous forest roads have been constructed, the use of tramways and ropeways has been extended and a great deal done in the erection of quarters for the subordinate staff and rest-houses for inspecting officers. On these objects seventy-five lakhs of rupees were spent during the quinquennium compared with about 53½ lakhs during the five years ending 1909. The use of mechanical transport in the extraction of forest produce is becoming more important each year and this question was considered by the Board of Forestry in 1913. The conclusion arrived at was that under Indian conditions monorails and road trains had not so far proved satisfactory, but that there was much scope for narrow-gauge forest tramways and that experiments should be made with any other means of mechanical transport likely to cheapen extraction. Tramways are in use in the Andamans, in the Goalpara Division of Assam, in the Chakrata Division of the United Provinces, and in Burma, and in all cases considerable economy in transport has been effected, while an important scheme for the construction of a steam tramway in the Ramnagar and Lansdowne Divisions of the United Provinces is now being considered. In Burma, skidders are being successfully used to extract logs from the forests and from river beds. Another important work of this class in that province is the Wegyi boom which is designed to catch logs while the stream is in high flood, the logs being then conveyed to the railway by the help of slipways, gantries, winches and short lengths of tramline. The installation has cost Rs. 2,26,027, and although on the whole it has worked well, many difficulties have been experienced and it is doubtful whether it will be permanently maintained in its present form.

To provide the necessary expert advice a Forest Engineer was appointed in 1913 for two years, and he has been engaged on various projects in the United Provinces, the Andamans and Burma. But with the inevitable extension in the use of mechanical appliances for extraction and transport one Engineer for the whole of India will be insufficient and there can be little doubt that in course of time the major provinces will require special Engineers of their own.

14. The question of the agency by which forest produce should be extracted has given rise to considerable discussion in the past and although certain general principles may be laid down, the form of agency most suitable to any particular province or area must necessarily depend upon local conditions.

*Agency of extraction.*

In forest administration the object in view is two-fold—first, to conserve and improve the forests, and this is the first concern of the trained staff, and

secondly, to secure to the tax-payer the greatest immediate benefit from their commercial working. To obtain the best commercial results departmental or private agency should be employed as circumstances dictate and provided always that Government receives a fair share of the profits earned private agency should be freely employed. But when this is done the term of the contract should on the one hand be sufficiently long to enable the initial outlay to be recovered, while on the other hand provision should invariably be made for a revision of the rates of royalty at stated intervals so that Government may not be deprived of its fair share of any rise in prices which may take place. Should it be found impossible to employ private agency on these terms, departmental working should be adopted and if this cannot be undertaken by the trained staff without prejudice to its work of conservation and improvement, there seems to be no reason why a separate staff specially trained in commercial exploitation should not be employed. At times, indeed, departmental working is essential as, for instance, in the extraction of little known timbers or other products for which it is desired to create a market, when for any reason the system of extraction by purchasers breaks down, or when it becomes necessary to prevent trade manipulation or the creation of a monopoly.

Having regard to these general principles, which in their opinion should govern the decision as to the form of agency to be employed, the Government of India are inclined to believe that in some parts of India departmental agency might perhaps be profitably employed more extensively than at present.

15. In recent years there has been a noticeable increase in the demand for forest products and several industries dependent on their supply have been or are about to be started. One of the most im-

*Commercial development.*

portant of these is the utilization of bamboos, savannah grasses and firwood for the manufacture of paper-pulp, and to assist the development of this industry a special expert has been employed. With the assistance of the Titaghur Paper Mills Company, Limited, trials in the manufacture of bamboo pulp have been carried out successfully on a commercial scale, and concessions for the extraction of bamboos have been granted to two firms in Burma and Bengal. The outbreak of war has delayed the commencement of manufacture but as large supplies of the raw material are available the outlook is distinctly promising. In the Punjab, a concession for the extraction of spruce and silver fir from the Kulu forests for the manufacture of wood pulp has been granted. Matters are less advanced as regards the grass pulp industry, but this is being seriously considered. In the United Provinces and Assam, enormous quantities of suitable grasses are available and if trials on a commercial scale be successful an important industry may be established.

The extraction of tanning materials has received attention for some time past, particularly in the matter of obtaining a satisfactory extract from the bark of mangroves. For this purpose a factory was established several years ago at Rangoon, but owing to the want of expert supervision was not very successful. In order to test the possibility of producing extracts of good quality on a commercial scale the services of a Tannin Expert have been obtained and he will probably reach India shortly bringing with him a small portable plant. The forests of India contain many valuable tanning materials other than mangrove bark. The possibility of utilizing these will be examined by the Expert and his appointment may result in the establishment of a new and important industry.

During recent years much has been done to stimulate the local manufacture of matches, tests with numerous Indian woods have been carried out and a report regarding their suitability and the prospects of this industry has been issued. Several match factories on modern lines have been established, and if a sufficient supply of match woods of good quality can be assured, there is no reason why the industry should not grow rapidly. The regular and cheap supply of suitable wood is, however, a real difficulty, and the establishment of special plantations is a matter deserving the attention of Local Governments.

The tea-box industry has received special attention in Assam, where it absorbs a considerable portion of the outturn of the forests, and has steadily grown, especially in the Assam Valley. The Local Administration has fostered the industry by remissions of royalty on tea-box wood, by devising

measures for the protection of timbers used for tea-boxes, and by forming experimental plantations of *simal*.

Large quantities of sleepers have always been obtained by the Indian railways from the forests in this country, but as the supply of first class sleeper woods such as *sāl* and *deodar* is limited, experiments in the antiseptic treatment of less durable timbers have been in progress for some years past. The Indian forests contain many timbers which, so far as structural qualities are concerned, are at least the equal of imported sleeper woods, and these, if treated antiseptically, should go far to meet the demands of the Indian railways. The best and most economical method of treatment has not yet been determined but experiments are being carried out. Arrangements, however, have already been made with the Railway Board for the delivery of a large number of treated *chir* pine sleepers from the forests of the United Provinces while a similar supply of *Gurjan* sleepers from the Andamans is under consideration.

Another important forest industry in which, under departmental management, marked progress has been made is the manufacture of rosin and turpentine from crude resin obtained by tapping pine trees in the Himalayan forests. In the Punjab and the United Provinces, new distilleries have been erected and in 1913-14 these turned out 27,429 maunds of rosin and 58,803 gallons of turpentine compared with 6,584 maunds of rosin and 14,604 gallons of turpentine ten years earlier. The Indian demand for these products, which are largely used in the manufacture of paper, paints and varnishes, is considerable and the local outturn has already affected imports from other countries. In the Punjab, a modern plant has been erected near Lahore and a large increase in the outturn is also expected in the United Provinces. It is not too much to expect that a considerable portion of the Indian demand for rosin and turpentine will soon be met by the Department.

This account of the improved methods of extraction now adopted and of the new industries which have been started is sufficient evidence that the officers of the Department are fully alive to the importance of the commercial development of the forests and that they now recognise that efforts to secure commercial success are as much a part of their duties as the scientific management of the forest property entrusted to their care.

16. In times of famine or fodder scarcity grass operations form an important part of the work of the Forest Department, especially in Bombay, the Central Provinces, the United Provinces and Madras. In the past few years very large quantities of grass have been sent from the forests of the two first named provinces to the Deccan districts of Bombay, and in 1911-12 famine areas in Gujerat were supplied with grass from the United Provinces. In the famine of 1913-14 the serious shortage of fodder in the affected areas of the United Provinces was made good from the local forests and from the Central Provinces.

17. The following statement shows the growth of forest revenue and expenditure during the past 50 years, the figures in all cases being the annual averages of the quinquennial periods. Further details will be found in the statements appended to this review:—

Financial Results.

*Financial Results of Forest Administration in British India from 1864-65 to 1913-14 (in lakhs of rupees).*

Quinquennial period.	Gross revenue (average per annum).	Expenditure (average per annum).	Surplus (average per annum).	Percentage of surplus to gross revenue.
	Lakhs.	Lakhs.	Lakhs.	Lakhs.
1864-65 to 1868-69	37.4	23.8	13.6	36.4
1869-70 to 1873-74	56.3	39.3	17.0	30.2
1874-75 to 1878-79	66.6	45.8	20.8	31.2
1879-80 to 1883-84	88.2	56.1	32.1	36.4
1884-85 to 1888-89	116.7	74.3	42.4	36.3
1889-90 to 1893-94	159.5	86.0	73.5	46.1
1894-95 to 1898-99	177.2	98.0	79.2	44.7
1899-1900 to 1903-04	196.6	112.7	83.9	42.7
1904-05 to 1908-09	257.0	141.0	116.0	45.1
1909-10 to 1913-14	296.0	163.7	132.3	44.7

Progress has been continuous and it is a striking fact that within 50 years the surplus has increased nearly ten-fold. Even allowing for the rise in the prices of forest produce this is highly satisfactory, and it is to be remembered not only that a substantial portion of the annual expenditure is absorbed by the cost of research and of silvicultural work for which no immediate return can be expected, but also that all capital expenditure is met from revenue. There is, too, the fact that each year large quantities of forest produce are given free or removed by right-holders. The average annual value of the produce so removed is over 62 lakhs of rupees, but this is a rough estimate only and does not represent the amount which would have been realized had the produce been sold.

Both in 1912-13 and in 1913-14, the surplus was over a million pounds sterling, and it may be anticipated with some confidence that in the near future this figure will be exceeded. With the steady protection of past years the value of the forest property has increased; with the construction of new roads and the adoption of mechanical means of transport extraction is being extended and cheapened; new and profitable industries are springing up; and with the adoption of more concentrated systems of management an increased outturn will be obtained.

Prior to the 1st April 1911 forest revenue and expenditure in the major provinces were shared equally between Imperial and Provincial, but in the minor provinces were wholly Imperial. In consequence of the recommendations made by the Royal Commission upon Decentralization, the terms of provincial settlements were altered with effect from the date mentioned, and revenue and expenditure were in the major provinces wholly provincialized. In the North-West Frontier Province, forest revenue is Provincial while the expenditure is half Imperial and half Provincial. In the other minor provinces (Coorg, Ajmer, Baluchistan and the Andamans) both revenue and expenditure are Imperial.

#### Research.

18. The Forest Research Institute at Dehra Dun was established in 1906; but for several years work was hampered by want of accommodation. The new

##### General.

buildings were completed in 1914 at a cost of over two and a quarter lakhs of rupees and consist of a main block containing museums and offices and a number of subsidiary buildings, chiefly laboratories.

The Institute, which is under the administrative control of the Inspector General of Forests, is in charge of the President, Mr. L. Mercer, C. I. E., and contains five main sections each in charge of a research officer, the branches of work being silviculture, forest botany, economic products, zoology and chemistry.

19. The work of the Sylviculturist comprises a study of the requirements of the more important trees, the collection of statistics relating to

##### Sylviculture.

the rate of growth of trees and the volume production of typical crops, as well as investigations regarding improved systems of management. The *sāl* (*Shorea robusta*) and the *chir* (*Pinus longifolia*) are the principal species which have been studied, and a monograph on the latter is now in the Press, while the question of *sāl* regeneration is being studied in most of the important *sāl* tracts of India. In addition the Sylviculturist is associated with local officers in the preparation of working plans on improved lines and has carried out many other investigations. Among the subjects dealt with may be mentioned experiments to ascertain the best rotation on which to work bamboos, the collection of statistics in the eucalyptus plantations of the Nilgiris, the causes and effects of the drought of 1907 and 1908 in the *sāl* forests of the United Provinces and the results of continued fire-protection on the regeneration of *sāl* in the forests of the Duars. Statistical work, which in connection with silviculture has an important bearing on the future management of the forests to the best advantage, was taken up systematically in 1910-11. The results cannot be fully apparent for some time to come, but the value of the work is being realized in India, and in several provinces the need for special officers has been felt. In Burma, one such officer is already employed on this work; in the United Provinces, a post of Sylviculturist has been sanctioned; and in Assam and Bihar and Orissa, a similar proposal is under consideration.

A beginning has been made in the formation of a sylvicultural museum, worthy of the Research Institute. The photographic branch of the Research Institute is in charge of the Sylviculturist, and large additions to the collection have been made during the past few years.

20. The work of the Forest Botanist comprises systematic botany, the study of forest grasses, the oecology of important species and the diseases of trees. Under the head of systematic botany the work done has included the special study of important genera, the identification of specimens for forest officers, the measures taken for the preparation of descriptive lists and local floras and the upkeep of the Dehra Dun herbarium. Complete floras scientifically compiled are desirable, but for the present simple descriptive lists which will enable forest officers to identify trees and shrubs not by minute botanical features but by easily recognised field characters are all that is necessary. A scheme for their preparation on these lines was approved by the Board of Forestry in 1913 and the work is in progress in most provinces.

The herbarium has grown considerably, partly by the incorporation of the valuable Saharanpur collection in 1908 and partly by the accumulation of new specimens. In this connection mention may be made of two new species (*Albizzia Lathamii* and *Spodiopogon Laccii*) which have been discovered and named after two officers of the Department. Special attention has been paid to forest grasses, as it is desirable not only to increase the commercial exploitation of the valuable kinds but also to afforest the extensive and less valuable grass tracts. It has been shewn that fifteen widely distributed species can be utilized for the manufacture of paper pulp.

In oecological work attention has been mainly devoted to the study of the *sāl* tree, with special reference to the cause of the dying back of seedlings, while in connection with diseases the most important work of the Botanist has been the study of the disease of *Pinus excelsa* caused by the fungus *Trametes Pini*.

21. The activities of the Forest Economist have covered a very wide field. An enquiry into the properties and uses of *sāl* timber has been completed with the exception of the portion dealing with tests of strength. The antiseptic treatment of Indian timbers is being investigated and in connection with the utilization of bamboos for the manufacture of paper pulp, to which reference has already been made, a report on the supplies available and on local conditions has been issued.

The utilization of Indian timbers for industrial purposes has received attention and the suitability of woods for such purposes as matches, pencils, cement blocks, paving blocks, railway wagons, etc., has been studied. Among minor products, inquiries were carried out in connection with tan barks, gums, resins, oleo-resins, oil seeds, oil grasses and fibres.

The museum of forest economic products, which was started in 1881 by Sir Dietrich Brandis, has been steadily enlarged and is now housed in the new Institute at Dehra Dun.

22. During the past five years the post of Forest Zoologist has been held by four officers, and work has in consequence suffered, but recently progress has been good. The pests of *sāl*, teak, and *Pinus longifolia* have been investigated, over 120 life histories having been studied in connection with these trees alone.

A study of the teak bee-hole borer, *Duomitus ceramicus*, Walk, was commenced in Burma, and other borers have also been identified, some of which are likely to prove of importance. A special study of the lac insect and of the parasites of *Butea lac* has been in progress, and a revision of the life history of *Tachardia lacca* will shortly be published by Dr. Imms. The entomological collection has rapidly increased, and over four thousand species have been added during the past few years.

23. The Chemical Adviser works in close touch with other research officers, especially with the Forest Economist. Among the chief investigations taken up may be mentioned the determination of tannin values of barks and other products, the distillation of oil from oil grasses, from pine needles and from *deodar* waste, the extraction of saleable products from the gum resin of *Boswellia serrata* and the improvement and standardization of Indian turpentine and rosin.

*Forest Chemistry.*

24. A list of publications issued by the Forest Research Institute during the period 1909-10 to 1913-14 is given in appended Statement XX.

*Forest literature.*

25. An enquiry into the effect of forests on the retention of atmospheric and soil moisture has been carried out. A large mass of evidence was collected and the conclusions arrived at, briefly summarized, were as follows:—So far as India is concerned, sufficient data are not available to enable any definite opinion to be formed regarding the influence of forests on the actual rainfall, but the denudation of the soil resulting from the destruction of forest vegetation may be looked on as an established fact. As regards the effect of forest preservation on the run-off of rain water and the underground water supply, sufficient evidence is not forthcoming to justify any change in the principles on which the forest policy of Government has hitherto been based. At the same time, useful results might be obtained if meteorological stations were established where local differences in the rainfall, temperature and humidity inside and outside forest areas would be recorded. It is also important that adequate measures, where necessary, should be taken to prevent the destruction of forests on areas liable to denudation.

*Relation between forests and the retention of atmospheric and soil moisture.*

L. J. KERSHAW,

*Secretary to the Government of India.*

## STATEMENT XX.

## FOREST PUBLICATIONS ISSUED DURING THE PERIOD 1909-10 TO 1913-14.

## I.—Publications of the Forest Research Institute.

	PRICE (exclusive of packing, postage, etc.)		
1.—LEAFLETS.			
	Rs.	A.	P.
The Larger Deodar Bark-Borer ( <i>Scolytus major</i> , Steb.), by E. P. Stebbing .	0	4	0
The Blue Pine "Polygraphus" Bark-Borer ( <i>Polygraphus major</i> , Steb.), by the same author .	0	3	0
2.—PAMPHLETS.			
Note on Lac and Lac Cultivation, by D. N. Avasia . . . . .	0	2	0
Notes on Sal in Bengal, by A. L. McIntire . . . . .	0	4	0
Note on Forest Reservation in Burma in the Interests of an Endangered Water- Supply, by A. Rodger . . . . .	1	0	0
Note on Andaman Marble Wood or Zebra Wood ( <i>Diospyros Kurzii</i> , Hiern.), by R. S. Troup . . . . .	0	4	0
Note on the Collection of Statistical Data relating to the Principal Indian Species, by A. M. F. Caccia . . . . .	0	10	0
Tables showing the Progress in Working-Plans in the Provinces outside the Madras and Bombay Presidencies up to 31st December 1908, by the same author . . . . .	0	10	0
Note on Burmese Leza Wood ( <i>Lagerstræmia tomentosa</i> , Presl.), by R. S. Troup .	0	2	0
Note on Carallia Wood ( <i>Carallia integerrima</i> , DC.), by the same author . . .	0	2	6
Note on Petwun or Trincomali Wood ( <i>Berrya Ammonilla</i> , Roxb.), by the same author . . . . .	0	4	0
Note on Burmese In Wood ( <i>Dipterocarpus tuberculatus</i> , Roxb.), by the same author . . . . .	1	0	0
Note on Burma Padouk ( <i>Pterocarpus macrocarpus</i> Kurz.), by the same author .	1	0	0
A Note on the Preservation of Bamboos from the Attacks of the Bamboo Beetle or "Shot-Borer," by E. P. Stebbing . . . . .	0	7	0
Note on the Best Season for Coppice Fellings of Teak ( <i>Tectona grandis</i> ), by R. S. Hole . . . . .	0	4	0
3.—BULLETINS (NEW SERIES).			
1.—Note on Calorimetric Tests of Some Indian Woods, by Puran Singh . . .	0	2	0
2.—Memorandum on Teak Plantations in Burma, by F. A. Leete . . . . .	0	10	0
3.—Note on the Relative Strength of Natural and Plantation-Grown Teak in Burma, by R. S. Pearson . . . . .	0	4	0
4.—Second Edition of the Glossary of Technical Terms for Use in Indian Forestry, by A. M. F. Caccia, revised by R. S. Troup . . . . .	0	6	0
5.—The Blue Pine Tomious Bark-Borer ( <i>Tomicus Ribbentropi</i> ), by E. P. Stebbing. . . . .	0	2	0
6.—Note on the Oil Value of Sandalwood, by Puran Singh . . . . .	0	2	0
7.—Note on the Chemistry and Trade Forms of Lac, by the same author . . .	0	3	0
8.—Note on Some Germination Tests with Sal Seed ( <i>Shorea robusta</i> ), by R. S. Troup . . . . .	0	2	0
9.—Note on Resin Value of <i>Podophyllum Emodi</i> and the best season for collect- ing it, by Puran Singh . . . . .	0	1	3
10.—Note on Bark-Boring Beetle Attack in the Coniferous Forests of the Simla Catchment Area, 1907—1911, by R. S. Hole . . . . .	0	3	0
11.—A further Note on some Casuarina Insect Pests of Madras, by V. Sabramania Iyer . . . . .	0	14	0
12.—Note on the Bark-Eating and Root-Boring Beetles of Babul ( <i>Acacia arabica</i> ) by E. P. Stebbing . . . . .	0	4	0
13.—Note on <i>Ligno Protector</i> as a possible means of preventing timber from splitting while seasoning, by R. S. Pearson . . . . .	0	5	0
14.—A further Note on the Relative Strength of Natural and Plantation-Grown Teak in Burma, by R. S. Pearson . . . . .	0	3	0
15.—Note on the Technical Properties of Timber with special reference to <i>Cedrela</i> <i>Toona</i> wood while seasoning, by R. S. Pearson. . . . .	0	3	0
16.—Note on Gumhar ( <i>Gmelina arborea</i> , Roxb.), by A. Rodger . . . . .	0	3	0
17.—Note on Bija Sal or Vengai ( <i>Pterocarpus Marsupium</i> , Roxb.), by the same author . . . . .	0	4	0

BULLETINS (NEW SERIES)—*contd.*

	PRION (exclusive of pack- ing, postage, etc.). Rs. A. P.
18.—Note on Sain or Saj ( <i>Terminalia tomentosa</i> , W. and A.), by A. Roger . . . . .	0 5 0
19.—Note on Benteak or Nana Wood ( <i>Lagerstræmia lanceolata</i> , Wall.), by the same author . . . . .	0 3 0
20.—Note on Sandan ( <i>Ougeinia dalbergioides</i> , Benth.), by the same author . . . . .	0 3 0
21.—Note on Dhaura or Bakli ( <i>Anogeissus latifolia</i> , Wall.), by the same author . . . . .	0 4 0
22.—Note on the Causes and Effects of the Drought of 1907 and 1908 on the Sâl Forests of the United Provinces. by R. S. Troup . . . . .	0 5 0
23.—Note on the Preparation of Indian Forest Floras and Descriptive Lists, by R. S. Hole . . . . .	0 4 0
24.—Note on Turpentines of <i>Pinus Khasya</i> , <i>Pinus Merkusii</i> and <i>Pinus excelsa</i> , by Puran Singh . . . . .	0 2 0

## 4.—RECORDS.

Vol. II, Part I.—On Some Insect Pests of the Himalayan Oaks ( <i>Quercus dilatata</i> and <i>Q. incana</i> ), by E. P. Stebbing . . . . .	0 6 0
„ „ II.—A Note on the Fissibility of some Indian Woods, by R. S. Troup . . . . .	1 6 0
„ „ III.—1. Monograph on the Sylviculture of <i>Hardwickia binata</i> (Anjan), by D. O. Witt . . . . .	3 4 0
„ „ 2. Notes on Sandal (Germination and Growth of Sandal Seedlings), by M. Rama Rao . . . . .	
„ „ IV.—Note on Host Plants of the Sandal Tree, by the same author . . . . .	2 0 0
Vol. III, „ I.—Note on some Statistical and other Information regarding the Teak Forests of Burma, by R. S. Troup . . . . .	2 12 0
„ „ II.—Preliminary Note on the Antiseptic Treatment of Timber in India with special reference to Railway Sleepers, by R. S. Pearson . . . . .	0 14 0
„ „ III.—Report on the Investigation of Bamboos as Material for Production of Paper-pulp, by W. Raitt . . . . .	0 6 0
„ „ IV.—Note on the Preparation of Tannin Extracts with special reference to those prepared from the Bark of Mangrove ( <i>Rhizophora mucronata</i> ), by Puran Singh . . . . .	0 7 0
Vol. IV, „ I.—Note on the Distillation and Composition of Turpentine Oil from the Chir Resin and the Clarification of Indian Rosin, by the same author . . . . .	0 9 0
„ „ II.—Note on some new and other species of Hymenoptera in the Collections of the Zoological Branch of the Forest Research Institute, Dehra Dun, by P. Cameron . . . . .	0 4 0
„ „ III.—Note on Useful Exotics in Indian Forests (No. 1 <i>Prosopis juliflora</i> , DC.), by R. S. Hole . . . . .	0 4 0
„ „ IV.—Note on <i>Albizia Lathamii</i> , by the same author . . . . .	0 3 0
„ „ V.—Note on the Utilization of Bamboo for the Manufacture of Paper-pulp, by R. S. Pearson . . . . .	2 6 0
Vol. V, „ I.—Note on the Tea-box Industry in Assam, by the same author . . . . .	0 4 0
„ „ II.—Note on Blue Gum Plantations of the Nilgiris ( <i>Eucalyptus Globulus</i> ), by R. S. Troup . . . . .	1 6 0
„ „ III.—Report on the Investigation of Savannah Grasses as Material for Production of Paper-pulp, by W. Raitt . . . . .	0 4 0

## 5.—MEMOIRS.

Note on the Manufacture of Pure Shellac, Vol. I, Part II, Chemistry Series, by Puran Singh . . . . .	0 8 0
On Some Undescribed Scolytidæ of Economic Importance from the Indian Region II, Vol. I, Part II, Zoology Series, by E. P. Stebbing . . . . .	0 4 0
Indian Woods and their Uses, Vol. I, Part I, Economy Series, by R. S. Troup . . . . .	2 12 0
Note on the Prospects of the Match Industry in the Indian Empire, Vol. II, Part I, Economy Series, by the same author . . . . .	1 12 0
Second Edition of the Monograph on "Lac Insect" ( <i>Tachardia lacca</i> ), Vol. I, Part III, Zoology Series, by E. P. Stebbing . . . . .	1 0 0
Note on Some Important Insect Pests of the Himalayan Coniferae (Treating of Deodar), Vol. II, Part I, Zoology Series, by E. P. Stebbing . . . . .	4 10 0
Note on the Insect Pests of the Chir Pine ( <i>Pinus longifolia</i> ), Vol. II, Part II, Zoology Series, by the same author . . . . .	1 14 0
Memoir on Some Indian Forest Grasses and their Ecology, by R. S. Hole . . . . .	5 8 0
Note on the Life-History of <i>Chermes Himalayensis</i> , Steb., on the Spruce ( <i>Picea morinda</i> ) and Silver Fir ( <i>Abies Webbiana</i> ), Vol. II, Part III, Zoology Series, by E. P. Stebbing . . . . .	1 12 0

	PRICE (exclusive of pack- ing, postage, etc.).
	Rs. A. P.
MEMOIRS— <i>contd.</i>	
Note on the Economic Value of <i>Shorea robusta</i> (Säl), Vol. II, Part II, Economy Series, by R. S. Pearson . . . . .	1 12 0
II.—Manuals, Floras and Other Publications.	
Manual of Botany, by R. S. Hole . . . . .	3 8 0
Indian Forest Utilization (Second Edition), by R. S. Troup . . . . .	2 12 0
Explanatory Notes on Forest Law (a new Edition of the Forest Law Manual) . . . . .	1 2 0
Preparation of Forest Working-Plans in India, by W. E. D'Arcy. Revised by A. M. F. Caccia (Fourth Edition) . . . . .	0 14 0
Second Edition of Manual of Silviculture . . . . .	1 0 0
Manual of Forest Mensuration, by R. S. Troup . . . . .	1 4 0
Surveying and Drawing Manual, by F. A. Brining and D. N. Avasia . . . . .	3 12 0
Practical Determination of the Girth Increment of Trees, by R. S. Troup . . . . .	0 4 0
Forest Flora of Chhota Nagpur, by H. H. Haines . . . . .	9 0 0
Translation of M. Jacquot's "Incendies en Foret," by C. E. O. Fischer . . . . .	0 14 0
Forest Flora of the Siwalik and Jaunsar Forest Divisions, U. P. (Revised Edition), by U. N. Kanjilal . . . . .	1 14 0
Commercial Guide to the Economic Forest Products of India, by R. S. Pearson . . . . .	1 0 0
List of Trees, Shrubs and Principal Climbers, etc., recorded from Burma, by J. H. Lace . . . . .	1 4 0

[illegible]
